(57) ABSTRACT

An electromagnetic actuator is provided that comprises a housing, a solenoid coil, and an armature. The armature is movably disposed in an interior cavity defined by the housing. Irregular gaps are formed between the armature and the housing to increase the initial force of the actuator and to improve the latching force of the actuator after the actuator has been actuated.

TITLE: Electromagnetic actuator having a high initial force
and improved latching

----- KWIC -----

Abstract Paragraph - ABTX (1):

An electromagnetic actuator is provided that comprises a housing, a solenoid coil, and an armature. The armature is movably disposed in an interior cavity defined by the housing. Irregular gaps are formed between the armature and the housing to increase the initial force of the actuator and to improve the latching force of the actuator after the actuator has been actuated.

Summary of Invention Paragraph - BSTX (4):

[0003] An electromagnetic actuator is a device that converts electrical energy into mechanical movement. It consists primarily of two parts, a solenoid coil and an armature. Generally, the coil is formed from wire that has been wound into a cylindrical shape. The armature is typically mounted to move or slide axially with respect to the cylindrically shaped coil. An electrical signal applied to the coil generates an electromagnetic field that imparts a force on the armature thereby causing the armature to move.

Summary of Invention Paragraph - BSTX (10):

[0008] In accordance with one aspect of the present invention, an electromagnetic actuator is provided and includes a housing, a solenoid coil and an armature. The housing has an end wall and defines a cavity. The end wall has non-coplanar first and second surfaces. The solenoid coil is disposed in the cavity of the housing. The armature is disposed substantially coaxially with the solenoid coil. The armature is movable between a first
